Main Idea**Title of disclosure (in English)**

Efficient mixing of sequential prefetches with random access data in a preexisting LRU cache

Idea of disclosure

1. Describe your Invention, stating the problem solved (if appropriate), and indicating the advantages of using the Invention.

Given an existing LRU cache for which it is impossible, or not desirable, to alter it in such a way as to efficiently accommodate sequential-oriented prefetched data this invention describes a process for prefetching data in such a way as to work efficiently with random accesses in said LRU cache.

Efficient mixing of sequential prefetches with random access data in a preexisting LRU cache - continued

The advantage of this technique is that it is not always possible, or desirable, to alter the replacement algorithm of an existing LRU cache. This invention is designed to work with a preexisting LRU cache without alteration. This applies even when the LRU cache is across a physical boundary, such as a computer host attempting to make use of the cache within an I/O subsystem for efficient caching of prefetched data.

2. How does the invention solve the problem or achieve an advantage, (a description of "the invention", including figures inline as appropriate)?

The invention describes a process for estimating the single reference residency time of elements within a cache and then using that information to model the utility of keeping prefetched data for I/O streams which are expected to benefit from cache prestaging.

The I/Os eligible for signalling prefetching are recorded in a computer model. Because of the single reference residency prediction the number of simulated prefetches remains relatively small. A sequential prefetch "count" is recorded with each element in the computer model, providing a basis for decision with regards to invoking an actual prefetch into the LRU cache in question. A measure of "goodness" (based on this "count") for prefetching exists such that the threshold value for prefetching eligibility can increase or decline depending upon the LRU cache's hit ratio performance.

3. If the same advantage or problem has been identified by others (inside/outside IBM), how have those others solved it and does your solution differ and why is it better?

I am not aware of prefetching algorithms which do not require some degree of modification to the LRU cache being prefetched into. A common "solution" is to maintain a sequential "count" (as described above) with each cache element, thus providing a measure of "goodness" for prefetch eligibility, however in every case that I am familiar with the "count" information needs to be added to the cache element information ^{in cache, not rewrite}, comprising the LRU cache, thus requiring a modification to the LRU cache in question.

4. If the invention is implemented in a product or prototype, include technical details, purpose, disclosure details to others and the date of that implementation.

This invention is not currently implemented in any product. I have an internal prototype which implements the algorithm. This internal prototype which is not associated with any specific product was created on 12/10/1999.

*Critical Questions (Questions 1 - 7 must be answered)

Question 1

On what date was the invention workable? 12/10/99. Please format the date as MM/DD/YYYY.
(Workable means, i.e., when you knew that your design will solve the problem)

Question 2

Is there any planned or actual publication or disclosure of your invention to anyone outside IBM? Yes No

If yes, Enter the name of each publication or patent and the date published below:

Publication/Patent:

Date Published or Issued:

Are you aware of any publications, products or patents that relate to this invention? Yes No

If yes, Enter the name of each publication or patent and the date published below:

Publication/Patent:

Date Published or Issued:

Question 3

Has the subject matter of the invention or a product incorporating the invention been sold, used internally in manufacturing, announced for sale, or included in a proposal? Yes No

Efficient mixing of sequential prefetches with random access data in a preexisting LRU cache - continued

Is a sale, use, or manufacturing, product announcement, or proposal planned?

Yes No

If yes, identify the product if known and indicate the date of planned date of sale, announcement, or proposal and to whom the sale, announcement or proposal has been or will be made.

Product
Version/Revision
Code Name
Date
To Whom

If more than one, use cut and paste and append as necessary in the field provided.

Question 4

Was the subject matter of your invention or a product incorporating your invention used in public, e.g., outside IBM or in the presence of non-IBMers?

Yes No

If yes, give a date. Please format the date as MM/DD/YYYY

Question 4

Have you ever discussed your invention with others not employed at IBM?

Yes No

If yes, identify individuals and date discussed. Fill in the text area with the following information: the names of the individuals, the employer, date discussed, under CDA, and CDAM.

Question 5

Was the invention, in any way, started or developed under a government contract or project?

Yes No Not Sure

If Yes, enter the contract number.

Question 7

Was the invention made in the course of any alliance, joint development or other contract activities?

Yes No Not Sure

If Yes, enter the following: Name of Alliance, Contractor or Joint Developer
Contract ID number
Relationship contact name
Relationship contact E-mail
Relationship contact phone

Question 9

Have you submitted, or are you aware of, any related disclosure submission?

Yes No

If Yes, please provide the title and docket or disclosure number below.

Efficient mixing of sequential prefetches with random access data in a preexisting LRU cache - continued

Question 9

What type of companies do you expect to compete with inventions of this type? Check all that apply.

- Manufacturers of enterprise servers
- Manufacturers of entry servers
- Manufacturers of workstations
- Manufacturers of PCs
- Non-computer manufacturers
- Developers of operating systems
- Developers of networking software
- Developers of application software
- Integrated solution providers
- Service providers
- Other (Please specify below)

Patent Value Tool (Optional - this may be used by the Inventor and attorney to assist with the evaluation)

(The Patent Value tool can be used by you or the evaluation team to determine the potential licensing value of your invention.)

The Patent Value Tool has not yet been used to calculate a score.

Efficient Mixing of Sequential Prefetches With Random Access Date in a Preexisting LRU Cache

Patent Review Board
IBM Confidential

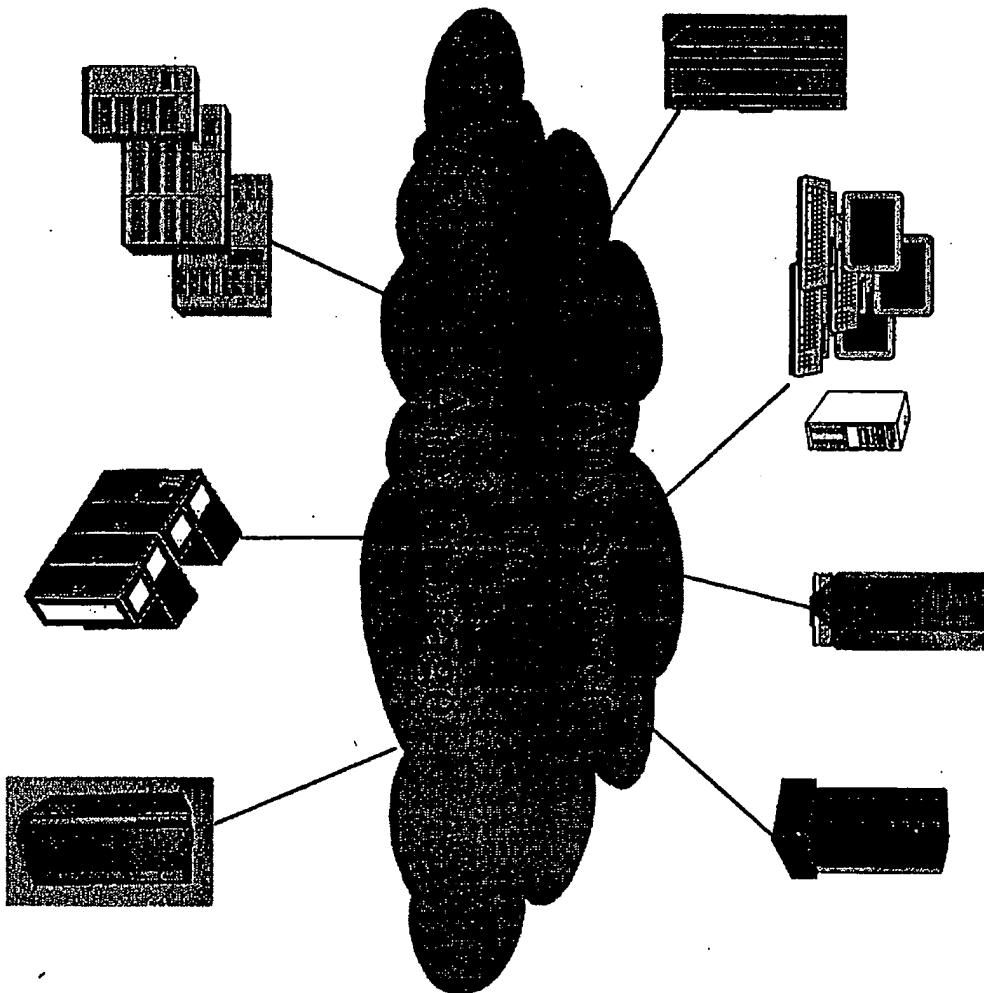

IBM Confidential

Efficient Prefetching w/LRU...

- Title:
 - ▶
- Product Name:
 - none (several candidates: CF, SAN)
 - Has not been disclosed.
- First Date Disclosed:
- Problem Solved:
 - ▶
 - Prefetch optimization in a black-box LRU caching system.
- Efficient Mixing of Sequential Prefetches with Random Access Data in a Preexisting LRU Cache.

Example use of the process in a SAN environment

IBM Confidential

Problem

- LRU cache logic sometimes inaccessible or undesirable to alter.
- LRU cache often accessed by external hosts or multiple hosts.
- Prefetched data is ideal for sequential accesses, which works poorly with LRU.
- Identifying prefetch candidates difficult.

Solution

- Solution is to:
 - Use model of prefetching effects to make decisions.
 - Estimate single ref. residency time.

IBM Confidential

Efficient Prefetching w/LRU

- Benefit over prior art.
- Competitors:
 - ▶ Improved identification of prefetch candidates.
 - Modification of LRU not required.
- Will others want to use it?
 - Consider a SAN with a cached control unit to preload into.
- Discoverable?
 - ▶ I/O requests in addition to workload together with a moving prefetch criteria.
 - Static prefetch determination.
- Alternatives?

IBM Confidential

The process for efficient prefetching w/LRU

- Determine cache size.
- Periodically fetch Hit Ratio, cached I/O rate and estimate the SRRT.
- For each I/O check the model's buffer, use previous element's sequential count.
- If above a dynamic threshold, prefetch.

The process for efficient prefetching w/LRU (continued)

- Load I/O requests + prefetches into model's buffer. Update LRU position on hit. Discard on overflow.
- Keep track of overflow point for each of multiple prefetch threshold criteria, counting prefetched "hits" for each criteria.
- If alternate prefetch criteria value is better, then consider adjustment.

IBM Confidential

Description of Invention

- Inputs:
 - Cache Size
 - periodic:
 - Hit Ratio feedback
 - Cached I/O Rate feedback
- Output:
 - Prefetch candidates identified
 - Optimal prefetch threshold identified
 - Value of prefetching quantifiable
